SafeLink R10 Personal AIS MOB

The SafeLink R10 transmits target survivor information, including structured alert messages, GPS position information and a unique serialised identity number back to the onboard plotter. An inbuilt high precision GPS receiver provides accurate position information to assist in quick recovery of survivors.

The SafeLink R10 will transmit continuously for a minimum of 24 hours and has a 7 year battery storage life.

It also features a flashing LED indicator light to aid detection at night and a self test facility with battery use indication.

How SafeLink R10 SRS works

- R10 SRS is activated manually in an emergency situation
- A unique emergency alert is transmitted to all AIS receivers and AIS enabled chart plotters within a 4 mile radius (typical)
- An AIS SART emergency alert icon (picture below) signals the requirement for urgent help
- Precise target survivor information including GPS position becomes viewable when the chart plotter cursor is positioned over the emergency alert icon
- Provides exact location, distance and bearing to locate person(s) in need of assistance
